STUDY OF PROTEUS AND KEIL MICRO VISION

AIM: To study the working procedures of Proteus and Keil Micro vision software.

Keil Micro Vision is a free software which solves many of the main points for an embedded program developer. This software is an integrated development environment (IDE), which integrated a text editor to write programs, a compiler and it will convert your source code to hex files too. µVision4 introduces a flexible window management system, enabling us to drag and drop individual windows anywhere on the visual surface including support for Multiple Monitors.

KEIL PROCEDURE:

1. Open the software, Click on project and open new version project.
2. Create a new project file
3. Enter AT89C51
4. Click NO
5. Click [Ctrl +N] and Type the code
6. Open project and click Build target
7. Open Build target and open source file and ADD, CLOSE
8. Click build target
9. Next debug start and stop
10. Open peripherals and select port 2
11. Now run the program in Debug
12. Open project and click optional properties and in that give output as hex file.
13. Create hex file.

PROTEUS PROCEDURE:

- Open proteus by clicking run as administrator.
- Open new project and enter the file name.
- Click next, next, next and finish.
- Click P symbol and search keyword and place the required components
- Now connect the components as required
- Give input to AT89C51 as HEX file.
- Start the simulation process

RESULT: Thus the Proteus and Keil Micro vision software were studied.

FLASHING OF LED USING AT89C51 MICROCONTROLLER USING PROTEUS

AIM:

To Write an assembly language program to flash the LED using AT89C51

SOFTWARES REQUIRED:

- Proteus software

PROGRAM

```
        ORG 0000H
    UP: SETB P2.0
        ACALL DELAY
        CLR P2.0

GENERATION OF SQUARE WAVE USING PROTEUS

AIM:

To write an assembly language program to Generate square wave using AT89C51.

SOFTWARE REQUIRED:

- Proteus 8 software.

PROGRAM

```
        ORG 0000H
    UP: SETB P2.0
        ACALL DELAY
        CLR P2.0
        ACALL DELAY

SMOOTH BRIGHTNESS CHANGE OF LED USING AT89C51 USING PROTEUS

AIM:

To write an assembly language program for Fade in Fade out of LED Using AT89C51 using Keil and Proteus

SOFTWARE REQUIRED:

- Proteus 8 software.

PROGRAM:

```
#include <REGX52.h>

STUDY OF ARM PROCESSOR

AIM:

To study the architecture and working of an ARM processor.

COMPONENT REQUIRED:

- ARM LPC2148

THEORY:

ARM is a family of instruction set architectures for computer processors based on a reduced instruction set computing (RISC) architecture developed by British company ARM Holdings. A RISC-based computer design approach means ARM processors require significantly fewer transistors than typical processors in average computers. This approach reduces costs, heat and power use. These are desirable traits for light, portable, battery-powered devices—including smartphones, laptops, tablet and notepad computers), and other embedded systems. A simpler design facilitates more efficient multi-core CPUs and higher core counts at lower cost, providing higher processing power and improved energy efficiency for servers and supercomputers.

Features of LPC214x Series Controllers:

- 8 to 40 kB of on-chip static RAM and 32 to 512 kB of on-chip flash program memory.128 bit wide interface/accelerator enables high speed 60 MHz operation.
- In-System/In-Application Programming (ISP/IAP) via on-chip boot-loader software. Single flash sector or full chip erase in 400 ms and programming of 256 bytes in 1ms.
- Embedded ICE RT and Embedded Trace interfaces offer real-time debugging with the on-chip Real Monitor software and high speed tracing of instruction execution.
- USB 2.0 Full Speed compliant Device Controller with 2 kB of endpoint RAM. In addition, the LPC2146/8 provides 8 kB of on-chip RAM accessible to USB by DMA.
- One or two (LPC2141/2 vs. LPC2144/6/8) 10-bit A/D converters provide a total of 6/14analog inputs, with conversion times as low as 2.44 us per channel.
- Single 10-bit D/A converter provides variable analog output.
- Two 32-bit timers/external event counters (with four capture and four compare channels each), PWM unit (six outputs) and watchdog.
- Low power real-time clock with independent power and dedicated 32 kHz clock input.
- Multiple serial interfaces including two UARTs (16C550), two Fast I2C-bus (400 kbit/s), SPI and SSP with buffering and variable data length capabilities.
- Vectored interrupt controller with configurable priorities and vector addresses.
- Up to 45 of 5 V tolerant fast general purpose I/O pins in a tiny LQFP64 package.
- Up to nine edge or level sensitive external interrupt pins available.
- On-chip integrated oscillator operates with an external crystal in range from 1 MHz to30 MHz and with an external oscillator up to 50 MHz.
- Power saving modes include Idle and Power-down.
- Individual enable/disable of peripheral functions as well as peripheral clock scaling for additional power optimization.
- Processor wake-up from Power-down mode via external interrupt, USB, Brown-Out Detect (BOD) or Real-Time Clock (RTC).

- Single power supply chip with Power-On Reset (POR) and BOD circuits – CPU operating voltage range of 3.0 V to 3.6 V (3.3 V ± 10 %) with 5 V tolerant I/O pads.

LPC2148 needs the following hardware to work properly:

- Power Supply
- Crystal Oscillator
- Reset Circuit
- RTC crystal oscillator
- UART

Power Supply

LPC2148 works on 3.3 V power supply. LM 117 can be used for generating 3.3 V supply. However, basic peripherals like LCD, ULN 2003 (Motor Driver IC) etc. works on 5V. So AC mains supply is converted into 5V using below mentioned circuit and after that LM 117 is used to convert 5V into 3.3V.

Reset Circuit

Reset button is essential in a system to avoid programming pitfalls and sometimes to manually bring back the system to the initialization mode. MCP 130T is a special IC used for providing stable RESET signal to LPC 2148.

Flash Programming Utility

NXP Semiconductors produce a range of Microcontrollers that feature both on-chip. Flash memory and the ability to be reprogrammed using In-System Programming technology.

On-board Peripherals

• 8-Nos. of Point LED's (Digital Outputs)

• 8-Nos. of Digital Inputs (Slide Switch)

• 2 Lines X 16 Character LCD Display

• I2C Enabled 4 Digit Seven-Segment Display

• 128x64 Graphical LCD Display

• 4 X 4 Matrix keypad

• Stepper Motor Interface

• 2 Nos. Relay Interface

• Two UART for Serial Port Communication through PC

• Serial EEPROM

• On-chip Real Time Clock with Battery Backup

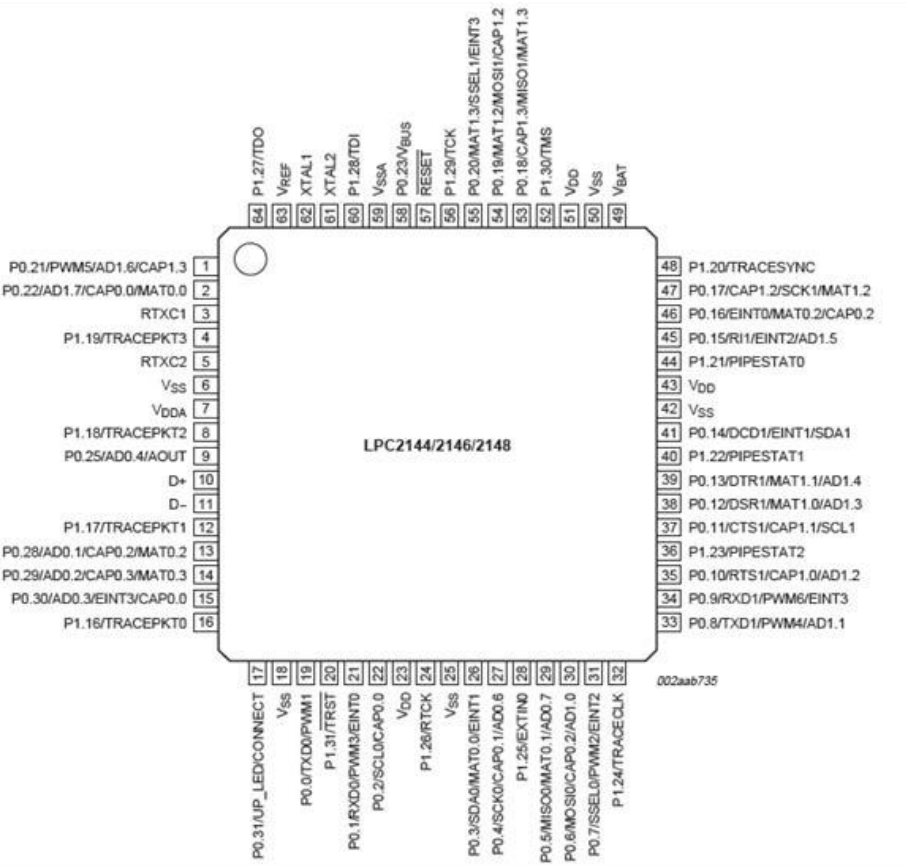
• PS/2 Keyboard Interface (Optional)

• Temperature Sensor

• Buzzer (Alarm Interface)

• Traffic Light Module (Optional)

Pin Configuration



Result:

The ARM processor has been studied successfully.

BLINKING LEDS USING SOFTWARE DELAY ROUTINE IN LPC2148 KIT

AIM:

To write and execute a C program to blink LEDs using software delay routine in LPC 2148 kit

APPARATUS REQUIRED:

Keil uVision5 Software

Philips Flah Programmer

LPC 2148 kit

PROGRAM:

```
#include "lpc214x.h"
void delay (unsigned int k);
void main(void)
{
IODIR0 = 0xFFFFFFFF; //Configure Port0 as output Port
PINSEL0 = 0;                    //Configure Port0 as General Purpose IO
while(1)
{
IOSET0 = 0x0000ff00;  //Set P0.15-P0.8 to '1'
delay(1000);          //1 sec Delay
IOCLR0 = 0x0000ff00;  //Set P0.15-P0.8 to '0'
delay(1000);          //1 Sec Delay
}
}
//Delay Program
//Input - delay value in milli seconds
void delay(unsigned int k)
{
        unsigned int i,j;
        for (j=0; j<k; j++)
```

```
                for(i = 0; i<=800; i++);
}
```

OUTPUT: LEDs P0.15-P0.8 are blinking

RESULT:

Thus the C program to blink LEDs using software delay routine was written and executed in LPC 2148 kit
